Baltimore, Maryland

Design and construction administration for a major utility infrastructure upgrade

Mueller Associates served as prime designer for two major renovations and the construction of a satellite central utility plant on the Coppin State campus, located in northwest Baltimore. The project doubled the existing chilled water plant capacity, replaced the campus's aging hot water boilers, providing distribution piping systems to serve existing and future buildings, and included the replacement of underground existing sanitary and cold water mains. Electrical distribution work included preliminary distribution to new South Campus buildings and revisions to existing power distribution to accommodate the new heating/cooling plant. Mueller also upgraded the fire alarm system campus-wide and added security systems to 11 existing buildings.
